

FIRECAP AFB SOCKET BOX INSERTS

The FIRECAP AFB Socket box inserts have been developed to provide maximum protection for penetrations created by the introduction of both single and double recessed socket boxes.

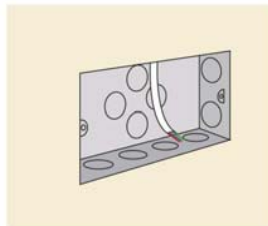

In a fire situation, the fire is unable to penetrate the insert which provides both integrity and thermal insulation reducing the risk of fire spread within the cavity and through the partition.

The penetration in the wall also provides a path for air, thus creating heat loss and drafts, the fitting of a FIRECAP Socket Box Insert minimises this problem.

Fitting Instructions

STEP ONE

Make small tight fitting hole through insert ready for cable

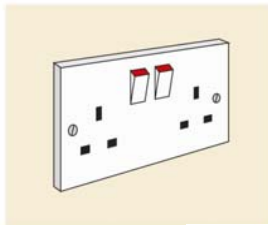

STEP TWO

Pass cable through insert and fit insert into socket box

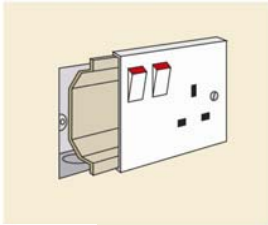

STEP THREE

Fit socket cover as normal, screws can pass through Insert material.

STEP FOUR

The flange of the Insert should be hidden by socket cover. Any rough edges can be trimmed.
